

Py

Day 02/55 - First Python Program

Writing your first command: Hello World

Prepared by Satyanarayan Sen

Video Summary

This video is a beginner-friendly introduction to writing the first Python program. It explains why coding matters in IT, how compilers and interpreters translate code, how OnlineGDB can help beginners practice quickly, and why the next step is installing Python locally for more control.

Core ideas from the lesson

Goal

Store, fetch, and process data through programming logic.

Translator

Compilers and interpreters convert human-readable code into machine language.

Practice

OnlineGDB lets beginners test code before installing tools locally.

First Code

Python starts simple: one print function can produce visible output.

1

The Goal of Coding

Programming is a way to instruct computers to store data, fetch it when needed, and process it into useful output. This is why coding is central to the IT industry: every application depends on data movement and logic.

Store

Fetch

Process

Output

Beginner takeaway

The black output screen is only the result area. What matters most is the logic you write and how the computer interprets it.

2 How Code Becomes Machine Instructions

Humans write readable commands, but computers execute machine-level instructions. A compiler or interpreter bridges that gap by translating code into something the machine can understand.

3 Using OnlineGDB for Quick Practice

For beginners who are not ready to install software, OnlineGDB is presented as a convenient browser-based playground. It supports multiple languages and is useful for quick experiments.

Practice Option	Why It Helps	Best Use
OnlineGDB	Runs code in the browser without local setup.	Quick experiments
Multiple languages	Useful when comparing C, Java, Python, VB, and more.	Basic exploration
Python 3 mode	Lets beginners try the exact first command shown in the lesson.	Hello World
Local setup later	Online tools are helpful, but local machines give more control.	Next tutorial

Learning mindset

Use online compilers to reduce friction. Once the logic feels comfortable, move to a local setup for control, files, packages, and real projects.

4 Writing Your First Python Code

The demonstration focuses on a one-line Python 3 command. The function `print` sends text to the output screen, making it the simplest visible proof that the program ran.

```
Python 3
print("Hello World")

# output
Hello World
```

What this line teaches

- 1 print**
A built-in function used to display output.
- 2 Text value**
Hello World is passed inside quotes.
- 3 Output**
Result appears after running.

5 Moving Forward

Online tools are useful for fast tests, but the host explains that a local machine setup gives more control. The next step is to install Python from the official website and use it for local practice.

Day 02/55 takeaway

Your first Python program does not need to be complex. Start with one clear command, understand the logic, then move toward a local setup for serious practice.
