

Skip or stop loops

```
continue
# skip this iteration

break
# exit the loop
```

continue and break change loop flow.

One skips a step. The other stops the whole loop.

continue

skips one turn

Skip divisible by 3

```
for num in range(1, 8):  
    if num % 3 == 0:  
        continue  
    print(num)
```

Condition

When num is divisible by 3, continue runs.

Skip rest

Python bypasses the remaining code in that turn.

Next turn

The loop jumps to the next value.

Debugger

continue flow

num = 3

```
if num % 3 == 0:
    continue
print(num)
# skipped
```

Printed values		
num	action	output
1	print	1
2	print	2
3	continue	-
4	print	4
5	print	5
6	continue	-
7	print	7

continue jumps back to the next loop iteration.

break

stops the loop

Stop at 5

```
for num in range(1, 8):  
    if num == 5:  
        break  
    print(num)  
print("bye")
```

Condition

When num becomes 5,
break runs.

Exit loop

Python leaves the entire
loop immediately.

After loop

Control moves to the
next outside line.

Debugger

break flow

num = 5

```
if num == 5:
    break
print(num)
print("bye")
```

Execution trace

num	action
1	print 1
2	print 2
3	print 3
4	print 4
5	break
loop	stopped
next	print bye

break exits the loop, then outside code continues.

Cheat Sheet

Python break and continue

Loop control

```
for item in data:
    if skip_condition:
        continue
    if stop_condition:
        break
    process(item)
```

continue

Skip the rest of the current iteration.

break

Stop the loop completely.

Debugger

Step through to see jumps in control flow.

After break

Python resumes at the first line outside the loop.

Save this for your Python journey.

Day 27/55 - Prepared by Satyanarayan Sen
