

Can Python Think?

```
if ready:  
    run()
```

It can choose a path.

That is where decision-making begins.

Calculation only

VS

Decision with if

Calculation only

```
>>> 5 + 7
12
>>> 10 * 3
30
```

Decision with if

```
score = 72
if score >= 50:
    print("Pass")
Pass
```

if lets code choose a path.

Curly braces

VS

Python indentation

Curly braces

```
if (ready) {  
    run();  
}  
// C / Java style
```

Python indentation

```
if ready:  
    run()  
# Python style
```

Python uses indentation to define the block.

Even check

VS

Odd check

Even check

```
num = 8
if num % 2 == 0:
    print("Even")
Even
```

Odd check

```
num = 7
if num % 2 != 0:
    print("Odd")
Odd
```

Use % 2 to test even or odd.

Cheat Sheet

Python if statement

Basic syntax

```
if condition:  
    code block
```

Colon

```
if x > 0:
```

Indentation

```
    print(x)
```

Boolean condition

```
x > 0    -> True
```

Even test

```
num % 2 == 0
```

Save this for your Python journey.

Day 20/55 - Prepared by Satyanarayan Sen
